

CONTROL PANEL CONNECTION

Craftsman
MARINE

The Craftsman Marine control panels can be connected to any 4/3 valve with a normally closed centre position and solenoids of 12/24VDC with a maximum control current of 10A. Connect the supplied cable to the valve solenoids according to the schematic below.

Please verify the correct direction of the thruster once the installation is completed. Should change of direction be required, simply swap the electrical connectors on the solenoids to achieve the correct direction in combination with the panel(s).
